

Some properties of Brzezinski crossed products

Florin Panaite (Institute of Mathematics of the Romanian Academy)

Abstract: *Brzezinski's crossed products are a common generalization of twisted tensor products of algebras, Hopf crossed products and quasi-Hopf smash products. In the talk we will define these concepts and will present two properties of Brzezinski's crossed products: a characterization of so-called equivalent crossed products and the description of a situation when crossed products may be iterated.*
